

Collaboration — short and painless

Goal: no merge conflicts, and everyone computes on the same data.

How it works:

1. `git pull` before you start, `git push` when you are done. (No git? See the fallback below.)
2. Do not touch the raw file `data/raw/regional_averages_tm_year.txt`.
3. Always start from `data/clean/temp_annual_regions.csv`.
4. Do not work in the main file `klima_analyse.ipynb`. Make your own copy as `scratch_<name>.ipynb` (or just your own notebook) and work there. One person merges at the end.
5. Save figures as `figN_*.png` in `figures/` (numbers as in the task list) — then nothing collides.

Getting started, one cell:

```
import pandas as pd
df = pd.read_csv("data/clean/temp_annual_regions.csv")
de = df[["jahr", "Deutschland"]].copy()
```

Fallback without git: I send the CSV via WhatsApp, everyone works locally in their own notebook and sends me notebook + figures at the end, and I merge.
