

WP I1 — How fast, and is it accelerating?

Linear regression of temperature on year. What matters is not just the slope (about 0.12 °C per decade) but the 95% confidence interval around it — that shows the trend is not random noise. Also fit the slope separately before and after 1980; the difference is the strongest single finding (roughly a sixfold increase). Output: one figure (points + line + confidence band) + slope with CI. Effort: medium.

Milestones / Deliverables

1. Checkpoint: analysis runs in your scratch, Fig 3 as draft(s), one sentence with a number.
2. Final (documented in the notebook): Fig 3 done + key figures; plus 2-3 sentences — what I computed, what the figure shows, why it looks that way, and how you can see it in the numbers.
3. Submission-ready: code runs top to bottom on “Restart & Run All”, fig3_*.png in figures/, pushed (or sent to the integrator).

Template: projekt_schritte.md Block 4. Work in a copy of the scratch (scratch_<yourname>.ipynb), start from ../data/clean/temp_annual_regions.csv.
