

WP I2 — Is the difference real or chance?

Compare two periods (1881–1950 vs. 1990–2025): difference of the means, then a bootstrap confidence interval (10,000 resamples, set seed 42 so it is reproducible) and as a cross-check a Welch t-test plus Cohen's d. If zero is not in the interval, the difference is not explained by sampling chance. Output: violin plot of the two periods + difference with CI. Effort: medium.

Milestones / Deliverables

1. Checkpoint: analysis runs in your scratch, Fig 4 as draft(s), one sentence with a number.
2. Final (documented in the notebook): Fig 4 done + key figures; plus 2–3 sentences — what I computed, what the figure shows, why it looks that way, and how you can see it in the numbers.
3. Submission-ready: code runs top to bottom on “Restart & Run All”, fig4_*.png in figures/, pushed (or sent to the integrator).

Template: projekt_schritte.md Block 5. Work in a copy of the scratch (scratch_<yourname>.ipynb), start from ../data/clean/temp_annual_regions.csv.
